Art Unit: 2123

DETAILED ACTION

1. Claims 1-26 have been presented for examination based on applicant's arguments filed on 3 April 2003. Claims 1-26 remain rejected by the examiner.

Response to Arguments

2. Applicant's arguments filed on 3 April 2003 have been fully considered but they are not persuasive.

Regarding applicant's response to 112(1) rejections: Applicants have argued that independent claims 1, 13, and 25 gain enablement for the claimed evaluation and control unit for comparing component information data with real picture data via the text contained on pages 15, line 19 through 18, line 20 of the specification. The examiner respectfully disagrees. For example, page 16, line 5 recites; "The evaluation-and-control-unit 5 converts the information contained in the source 201 of the image memory 20 into a prepared source 51. However, the specification never sufficiently discloses how this is accomplished. The text beginning on page 16, line 7 attempts to describe the process but does not disclose the following:

How is the **geometric assignment** 54 used to describe which **geometric elements** of a component 61 could be matched with the geometric elements for a **source assignment** 52?

How is the geometry assigned?

What geometry is assigned?

What are the geometric elements??

Art Unit: 2123

On page 18 reference is made to either the pixels 202 or the CAD elements 205 being converted into geometric elements (e.g., point 55, line 56, curve 57) which are used by the evaluation-and-control-unit in assigning the selected components but never discloses how the conversion or the assignment is performed.

Accordingly, the examiner assets that one skilled in the art would be at odds to determine how to make and/or use the claimed invention without undue experimentation.

The examiner maintains the 112(1) rejections.

Regarding applicant's response to 103(a) rejections: Applicants are reminded that In the previous office action the examiner made the following statement on page 4 of paper #7.

"While the specification for the claimed invention is delinquent in the areas cited above (see 112(1) rejections), the examiner has made prior art rejections based on the limited scope of the information contained in the specification."

In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See In re Keller, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); In re Merck & Co., 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986). It is noted that appellant's arguments regarding prior art have essentially only

Art Unit: 2123

recited the prior art teaching followed by a recitation of the claims without pointing out
the patentable distinction between the claimed invention and the prior art.

In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., an image recording system (page 5, line 8), functional interplay between objects (page 9, line16) compared with the behavior of a virtual model (page 9, line 17)) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See In re Van Geuns, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993). Applicants have also argued "exemplary" embodiments of prior art. Such arguments are not considered.

In response to applicant's arguments, the recitation "generating the virtual image of a real installation" has not been given patentable weight because the recitation occurs in the preamble. A preamble is generally not accorded any patentable weight where it merely recites the purpose of a process or the intended use of a structure, and where the body of the claim does not depend on the preamble for completeness but, instead, the process steps or structural limitations are able to stand alone. See In re Hirao, 535 F.2d 67, 190 USPQ 15 (CCPA 1976) and Kropa v. Robie, 187 F.2d 150, 152, 88 USPQ 478, 481 (CCPA 1951).

In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention

Art Unit: 2123

where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See In re Fine, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and In re Jones, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, prior art (Marks) provides sufficient motivation as cited under 103(a) rejections. (see Marks CL1-L42, L60)

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claims 1-12 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Specifically, in independent claim 1 applicant's are claiming an evaluation and control unit for comparing component information data with real picture data but the specification does not disclose an algorithm or technique for comparing component information data with real picture data. Neither the operation of the evaluation and control unit, nor the process of identifying components in picture data, nor the claimed deriving hypotheses, is sufficiently described in the specification to allow one skilled in the art to make and/or use the invention.

Art Unit: 2123

While page 4, line 5 of the specification state that the evaluation and control unit controls the process of generating the virtual installation model and controls an "automatic function" (page 5, line 13), it does not sufficiently describe functional operation either the process or the "automatic function". Obviously, one skilled in the art would not be able to create an "automatic function" without specific details on how the automatic function operates. Merely stating that the evaluation and control unit "processes component data" (page 8, line 8) and "performs image analysis" (page 8, line 20) does not provide a sufficient description to allow one skilled in the art to make and/or use the invention. Dependent claims inherit these defects.

Claims 13-26 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for "generating picture data" and "storage to store", does not reasonably provide enablement for "comparing picture data to identify installation components" (claim 13) or "a processing unit to compare components". The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention commensurate in scope with these claims.

Specifically, independent claim 13 claims comparing picture data to identify installation components within the picture data but again the specification does not disclose an <u>algorithm or technique</u> for performing the comparison or identifying the components.

Art Unit: 2123

Independent claim 25 claims a **processing unit to compare components** but does not disclose the <u>process for comparing components</u> sufficient to allow one skilled in the art to make and/or use the invention.

Dependent claims inherit these defects.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 4. Claims 1-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 6,025,847 issued to Marks in view of U.S. Patent 6,477,266 issued to Asar in further view of U.S. Patent 5,552,984 issued to Crandall et al.

While the specification for the claimed invention is delinquent in the areas cited above (see 112(1) rejections), the examiner has made prior art rejections based on the limited scope of the information contained in the specification.

Page 8

Art Unit: 2123

Independent claim 1 is drawn to:

Generating an image of installation model by:

Memory (1st) for storing picture data

Memory (2nd) for storing component information

Memory (3rd) for storing virtual installation model

Evaluation and control unit for comparing component information data with real picture data Identifying components in picture data as installation components

Deriving a hypotheses for identified components in picture data

Generating respective installation components in virtual installation model

Regarding independent claim 1: Marks teaches a system and method of generating a 3D (virtual) model from an image (picture) using a computer system.

The image is of an arrangement of physical objects (components) where primitives (geometric) representing a portion of a physical object (a component) in the image are specified as a set of parameters that correspond locations in the image model. Marks further discloses incorporating a memory space for storing picture data, component (object) information. (Abstract, Summary of Invention, Figs. 1-7, CL3-L2-10, CL4-L45, CL7-L35-67, CL7-L5-50)

Marks does not explicitly teach comparing component information data with real picture data.

Asar teaches a system and method for identifying components by **comparing component information data** with **real picture data** and incorporating multiple memories for storing picture data and component information. Asar further discloses evaluating (deriving a hypotheses via the image control system) identified components in the picture data by determining defects and placement errors and generating a respective image of the **installation of components**. (Abstract, Summary of Invention, Figs. 9-25, CL3-L29-43, CL5-L12-25, CL6-L10-35)

Art Unit: 2123

Marks mentions, but further does not explicitly teach virtual components (installation).

Crandall teaches generating a virtual model of a real system using virtual components (installation components) from a library of components representing the total virtual system (installation). (Abstract, Summary of Invention, Figs. 1a&b, 9, CL2-L5-11, CL4-L1-29)

It would have obvious to one of ordinary skill in the art at the time the claimed invention was made to modify the teachings of Marks relating to a system and method for generating a 3D (virtual) model from an image (picture), with the teachings of Asar relating to identifying components by comparing component information data with real picture data, and to further modify the teachings of Marks with the teachings of Crandall relating to generating a virtual model of a real system using virtual components (installation components) from a library of components representing the total virtual system (installation), to realize a device and method for generating a virtual model of an installation. An obvious motivation exists since, as referenced by prior art, creating a 3D (virtual) model of physical objects provides more efficient detection of discrepancies between the model and the actual image.

Regarding dependent claims 2-4: Asar performs image analysis on picture data as previously cited above. (CL2-L5-11) Crandall teaches using **virtual components** (installation components) from a library of components representing the total **virtual system** (installation) (CL2-L5-11). Marks teaches objects being located by geometric

information and multiple window views of picture data and 3D (virtual) model views. (CL4-L10-25, Figs. 2-7)

Regarding dependent claims 5-9: Marks discloses building a 3D (virtual) model using the well-known techniques of "dropping", "clicking and dragging", and "rubber banding" in the manipulation of primitives based on geometric information (CL4-L42).

Marks also teaches the evaluation of structural components (by function) to assign primitives (add components) in a 3d (virtual) installation model. (Figs. 9-25, CL3-L29-43, CL5-L12-25, CL6-L10-35)

Regarding dependent claims 10-12: Marks teaches the "automatic" component location (CL7-42) and a system incorporating a digital camera, digitized photographs (picture data), and a CAD system with memory and a multiple perspective view display. (Abstract, Summary of Invention, Figs. 1-7, CL3-L2-10, CL4-L45, CL7-L35-67, CL7-L5-50)

Independent claim 13 is drawn to:

Generating an image of real installation model by: Generating picture data comparing component information data with picture data Identifying components in picture data as installation components

Regarding independent claim 13: As previously cited, Marks teaches a system and method of generating a 3D (virtual) model from an image (picture) using a computer system. The image is of an arrangement of physical objects (components) where primitives (geometric) representing a portion of a physical object (a component)

Art Unit: 2123

in the image are specified as a set of parameters that correspond locations in the image model. (Abstract, Summary of Invention, Figs. 1-7, CL3-L2-10, CL4-L45, CL7-L35-67, CL7-L5-50)

Marks does not explicitly teach comparing component information data with real picture data.

Asar teaches a system and method for identifying components by comparing component information data with real picture data and incorporating multiple memories for storing picture data and component information. Asar further discloses evaluating (deriving a hypotheses via the image control system) identified components in the picture data by determining defects and placement errors and generating a respective image of the installation of components. (Abstract, Summary of Invention, Figs. 9-25, CL3-L29-43, CL5-L12-25, CL6-L10-35)

Marks mentions, but further does not explicitly teach virtual components (installation).

Crandall teaches generating a virtual model of a real system using virtual components (installation components) from a library of components representing the total virtual system (installation). (Abstract, Summary of Invention, Figs. 1a&b, 9, CL2-L5-11, CL4-L1-29)

It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to modify the teachings of Marks relating to a system and method for generating a 3D (virtual) model from an image (picture), with the teachings of Asar relating to identifying components by comparing component

Art Unit: 2123

information data with real picture data, and to further modify the teachings of Marks with the teachings of Crandall relating to generating a virtual model of a real system using virtual components (installation components) from a library of components representing the total virtual system (installation), to realize a device and method for generating a virtual model of an installation. An obvious motivation exists since, as referenced by prior art, creating a 3D (virtual) model of physical objects provides more efficient detection of discrepancies between the model and the actual image.

Regarding dependent claims 14-16: As also previously cited, Asar teaches image analysis on picture data as previously cited above. (CL2-L5-11) Crandall teaches using virtual components (installation components) from a library of components representing the total virtual system (installation) (CL2-L5-11) Marks teaches the manipulation of primitives based on geometric information (CL4-L42) and multiple window views of picture data and 3D (virtual) model views. (CL4-L10-25, Figs. 2-7).

Regarding dependent claims 17-24: Marks discloses building a 3D (virtual) model using the well-known techniques of "dropping", "clicking and dragging", and "rubber banding" in the manipulation (matching) of primitives based on **geometric information** (CL4-L42). Marks also teaches the **evaluation** of structural components (by function) to assign primitives (add components) in a 3d (virtual) installation model. (Figs. 9-25, CL3-L29-43, CL5-L12-25, CL6-L10-35) It further would have been obvious, and necessary, to "select" and "drag" installation components since all modern GUI based CAD system operate in this manner. Marks further teaches "automatic" component location (CL7-42) and a system incorporating a digital camera, digitized photographs

Art Unit: 2123

(picture data), and a CAD system with memory and a multiple perspective view display. (Abstract, Summary of Invention, Figs. 1-7, CL3-L2-10, CL4-L45, CL7-L35-67, CL7-L5-50)

Regarding claims 25 and 26: Claims 25 and 26 merely claim the virtual model of a facility that includes the same limitations as disclosed in claims 1-24. Claims 25 and 26 are therefore rejected using the same reasoning as previously cited above.

Conclusion

5. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure, careful consideration should be given prior to applicant's response to this Office Action.
